ABSTRACT:

We are studying 10 Creutzfeld Jakob Diseases, in 2021, from an anamnestic point of view, centered on the chronological aspect of the evolution of this new prion disease, without being able to have an explanation of the etiopathogenic aspect of this new entity.

We describe the first princeps case, Doyer Mauricette, who happens to be worldwide known and we correlate it with the 9 other reports.

We subsequently recall the usual history of this dreadful subacute disease, and compare it with this new, extremely acute, prion disease, following closely vaccinations.

In all 10 cases, we can place special emphasis on the remarkably very similar timing of the clinical semeiology.
